Product: MRLDS-450 Gas Detector

Issue: Avoiding Power Up Into An Open-Loop Fault

The MRLDS-450 Gas Detector by default has the analog output configured to 4-20mA. One of the features of the 4-20mA analog output is to alarm the sensor when an open-loop is detected on the 4-20mA circuit. If the +24VDC power is connected and the circuit is energized, the MRLDS-450 will detect an open-loop fault and alarm if:

- The 4-20mA circuit is not connected before the sensor is powered, or
- A jumper is not installed and tightened onto the analog output terminal block

Procedure

To avoid the open-loop fault on power up, the 4-20mA circuit can be deployed (wiring and configured to BMS or other) or install a jumper on the analog output terminal block as follows:

The fault can also be cleared by changing the Analog Output to a voltage (0-5V, 1-5V, 0-10V or 2-10V).
