1 Introduction

1.1. Overview

The MRLDS-250 NDIR (non-dispersive infrared) is a state-of-the-art fixed gas detector that can detect a wide range of refrigerant gases. The MRLDS-250 can be used on a stand-alone basis or integrated into controls or a Building Management System (BMS).

The MRLDS-250 can be used in locations that require continuous monitoring and to add gas detection solutions to an existing system.

![MRLDS-250 Components](image)

**Figure 1-1 - MRLDS-250 Components**

1.2. Detection Options

1.2.1. Broadband vs. Gas Specific

The MRLDS-250 NDIR refrigerant gas detectors are available in two versions: broadband and gas-specific.

1.2.2. Broadband Gas Detection

The broadband gas detector (P/N 809-0030) is used as a general purpose gross leak detector and is factory tested and certified. It is shipped from the factory with accuracy as shown in Table 1-1 (gas dependent). If more accurate detection is needed, gas specific versions are available, which are factory certified and calibrated to the target refrigerant.

The broadband gas detector combines refrigerants into 4 groups shown in **Figure 1-2**. Measurement performance is based on an average response profile for all of the gases within the group.

Table 1-2 Gas-specific Detector Measurement Performance

$^1$See Section 5, Configure the Gas Detector for Information on Parameter 11 and other configuration instructions.

Figure 1-3 - Gas-Specific MRLDS-250 Gas Detectors

NOTE: Emerson recommends not re-calibrating gas-specific detectors in the field to a new target gas; purchase a new gas-specific detector instead. In the event you prefer not to purchase a new gas-specific detector, use optional calibration instructions in Chapter 6 for increased accuracy when detecting a new target that is different from the “as shipped” target gas. Refer to the example in Table 1-3.
1.3. Remote Controller Options

The MRLDS-250 can connect to any controller through the standard analog output (voltage and current; see Table 1-4 for options), the standard alarm relay, or the digital Modbus RTU communications interface.

### Table 1-4 Parts List

Table 1-4 shows a list of components that are available.

Table 1-5 - Specifications
2 Mounting the Gas Detector

2.1. Warnings and Prerequisites

WARNING: Explosion hazard! Do not mount the MRLDS-250 in an area that may contain flammable liquids, vapors, or aerosols. Operation of any electrical equipment in such an environment constitutes a safety hazard.

CAUTION: The MRLDS-250 contains sensitive electronic components that can be easily damaged. Do not touch or disturb any of these components.

NOTE: The mounting location of the monitor should allow it to be easily accessible for visual monitoring and servicing.

NOTE: The gas detector must be connected to a marked, suitably located and easily reached switch or circuit breaker as means of disconnection.

CAUTION: Connect monitor power and signaling terminals using wiring that complies with local electrical codes or regulations for the intended application.

CAUTION: Do NOT mount the MRLDS-250 directly to vibrating machinery as the vibrations may degrade the gas detector’s performance.

2.2. Mounting Locations

2.2.1. General Placement Guidelines

NOTE: The MRLDS-250 should be installed plumb and level and securely fastened to a rigid mounting surface.

NOTE: When installed in areas that may be subjected to water spray, the optional splash guard (P/N 603-1100) should be used in conjunction with the MRLDS-250.

Gas detectors must be located within the appropriate wire lengths from the central controller (if used).

2.2.2. Machinery Rooms

There is no absolute rule in determining the number of gas detectors and their locations. However, a number of simple guidelines can help in making a decision. Gas detectors monitor a point as opposed to an area. If the gas leak does not reach the detector, no alarm will be triggered. Therefore, it is extremely important to select the gas detector location carefully. Also consider ease of access for maintenance.
The size and nature of the site can help in deciding which method is the most appropriate to use. Locations requiring the most protection in a machinery or plant room would be in close proximity to compressors, pressurized storage vessels, refrigerant cylinders, storage rooms, or pipelines. The most common leak sources are valves, gauges, flanges, joints (brazed or mechanical), and filling or draining connections.

- In machinery rooms where there is little or no airflow, placement options are:
  - **Point Detection**: where gas detectors are located as near as possible to the most likely sources of leakage, such as the compressor, expansion valves, mechanical joints, or cable duct trenches.
  - **Perimeter Detection**: where gas detectors completely surround the area or equipment.

- Halocarbon and hydrocarbon refrigerants are heavier-than-air gases and as such, the gas detectors should be located near ground level (6 to 18 inches from the floor).

  **NOTE**: Gas detectors should be positioned just far enough back from any high-pressure parts to allow gas clouds to form and be detected. Otherwise, a gas leak might pass by in a high-speed airflow area and go undetected by the gas detector.

  - Make sure that pits, stairwells, and trenches are monitored since they may fill with stagnant pockets of gas.
  - For racks or chillers pre-fitted with refrigerant gas detectors, these should be mounted so as to monitor the compressors.
  - Do not mount the gas detector directly to pipes or structures that are subject to strong vibration.

### 2.2.3. Refrigerated Spaces

In refrigerated spaces, gas detectors should be located away from doors, in the return airflow to the evaporators on a sidewall (below head-high is preferred), or on the ceiling, not directly in front of an evaporator, nor in any direct airflow. In large rooms with multiple evaporators, gas detectors should be mounted on the central line between two adjacent evaporators, as turbulence will result in airflows mixing.

### 2.2.4. Chillers

In the case of small water- or air-cooled enclosed chiller units, mount the gas detector to monitor airflow to the extract fans. With larger models also place a gas detector inside the enclosure under or adjacent to the compressors.

For enclosed air-cooled chillers or the outdoor unit for variable refrigerant volume and variable refrigerant flow (VRV/VRF) systems, mount the gas detector to monitor airflow to the extract fan. With large units also place a gas detector inside the enclosure under or adjacent to the compressors.

### 2.3. Mounting Procedure

To open the housing as received, use a flat blade screwdriver and depress the top latch. While pushing the latch, grasp the back edge of the housing near the latch and pull the back away.

When mounted, the housing is simply opened by pressing the top latch with a suitable screwdriver or other flat blade. With the top latch depressed, pull the housing apart by grasping the sides and pulling straight out. With the housing separated, the mounting base with terminal blocks will be visible.

See Figure 2-1.

**CAUTION**: Do not apply caulking or other material around the gas detector base. The gas detector relies on air exchange through the spaces between the base and the gas detector housing. Do not obstruct the small gap around the housing and the base with any material.
<table>
<thead>
<tr>
<th>Step</th>
<th>Mounting Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Open the housing (see Figure 2-1).</td>
</tr>
<tr>
<td>2</td>
<td>Position the base to the pre-determined (acceptable) mounting location. Use the gas detector base to mark the mounting locations as needed. The hole pattern on the backplate is sized to mount the gas detector onto various electrical junction boxes. The other holes may be used as needed to mount the gas detector to other structures, or onto a wall.</td>
</tr>
<tr>
<td>3</td>
<td>For Wall Mount, attach the MRLDS-250 base to the mounting surface using two #6 screws (provided) through two of the 7 mounting holes, and be careful not to over-tighten the screws. Refer to Figure 2-2 for the locations of mounting holes on the base. For Junction Box Mount, attach the MRLDS-250 base to the junction box (using mounting hardware provided with your junction box) through the two junction box holes. Refer to Figure 2-2 for the locations of the two junction box mounting holes on the base.</td>
</tr>
<tr>
<td>4</td>
<td>Unless you are ready to wire the device (see Section 3, Wiring and Configuration), carefully snap the cover onto the base unit.</td>
</tr>
</tbody>
</table>

**Table 2-1 Mounting Procedures**
3 Wiring and Configuration

3.1. Overview

Prior to wiring and configuring the MRLDS-250, ensure the following conditions have been met:
• MRLDS-250 backplate is mounted in an appropriate location.
• The cover panel is removed.
• If the cover panel was reattached after mounting, open the gas detector enclosure by pressing the top latch with a suitable screwdriver or other flat blade. With the top latch depressed pull the housing apart by grasping the sides and pulling straight out. Align and press together to close.

NOTE: The pre-installed cable gland (left) and the optional cable on the gland (right) have a 1/4 cable capacity (each).

NOTE: Install the optional cable gland in the right side of the base unit if needed. Otherwise, install the blanking plug that is included in the mounting kit.

3.2. Wiring Supply Power (24VAC or 24VDC)

CAUTION: Incorrect wiring may permanently damage the gas detector and void the warranty. Double check all terminations before applying power.

Either 24VAC or 24VDC may be used to power the MRLDS-250. Connect wiring to the appropriate terminal locations (see Table 3-1. Use two wires, between 14 and 22 AWG. Refer to Figure 3-2 for (AC wiring left) or DC wiring (right).

Table 3-1 - Power Options and Terminal Block Connections

<td>24V DC ground</td>
</tr>
</tbody>
</table>

Figure 3-2 - Supply Power Wiring Options

Figure 3-1 - Terminal Blocks and Cable Glands
3.3. Wiring Alarm Output (Analog Signal)

The MRLDS-250 provides an analog output signal that is proportional to the level of gas detected.

**NOTE:** No jumpers or hardware switch settings are required to configure the analog output. This is done electronically from the front panel display.

Connect two 18 to 20 AWG wires to terminal block positions 5 and 6 (see Figure 3-4), noting ground and signal polarity per Table 3-2.

**Table 3-2 - Alarm Output Terminal Block Connections**

<table>
<thead>
<tr>
<th>Function</th>
<th>Pin</th>

</tr>
</thead>
<tbody>
<tr>
<td>Analog</td>
<td>5</td>
<td>Analog output ground</td>
</tr>
<tr>
<td>Output</td>
<td>6</td>
<td>Analog output signal (+)</td>
</tr>
</tbody>
</table>

The type of output signal on pins 5 and 6 is programmable using the analog output type parameter P.-03. Refer to Section 5, Configure the Gas Detector for details.

3.4. Wiring the Digital Alarm Output Relay

An alarm setpoint may be programmed from the front panel of the MRLDS-250. When the level of the detected gas exceeds the alarm setpoint, the MRLDS-250 enters the alarm state. An on-board relay is tied to the alarm state, so you may activate (or deactivate) external equipment based on the MRLDS-250’s current alarm status.
NOTE: The relay can be programmed to be failsafe (normally energized). By default, the relay is set to be normally de-energized. This can be set using parameter P-06.

Make relay connections (NO, NC, or both) using 18 to 20 AWG wires to terminal block positions 10, 11, and 12 (see Figure 3-5), noting normally open, normally closed, and common connectors per Table 3-3.

### Table 3-3 - Relay Output Terminal Block Connections

</tr>
<tr>
<td></td>
<td>11</td>
<td>Relay common contact</td>
</tr>
<tr>
<td></td>
<td>12</td>
<td>Relay NO contact</td>
</tr>
</tbody>
</table>

### 3.5. MODBUS Network Configuration

If your application includes a MODBUS network, make network connections (RS-485 A and RS-485 B) using 18 to 24 AWG shielded twisted pair wires (with 120 ohm characteristic impedance) to terminal block positions 7 and 8 (see Figure 3-6) noting inverted B (-) and non-inverted A (+) signal connectors per Table 3-4.

### Table 3-4 - MODBUS Network Communications Connections

<table>
<thead>
<tr>
<th>Function</th>
<th>Pin</th>
<th>Wiring Termination</th>
</tr>
</thead>
<tbody>
<tr>
<td>MODBUS Network Communications</td>
<td>7</td>
<td>RS-485 “B” (inverted)</td>
</tr>
<tr>
<td></td>
<td>8</td>
<td>RS-485 “A” (non-inverted)</td>
</tr>
<tr>
<td></td>
<td>9</td>
<td>RS-485 shield</td>
</tr>
</tbody>
</table>

CAUTION: For MODBUS network communications wiring, use only 18-24 AWG shielded twisted pair wire with 120 ohm characteristic impedance.
CAUTION: Connect the RS-485 cable shield to pin 9 (board ground).

NOTE: Selection of the MODBUS Address and Baud Rate is completed through the gas detector setup menu, described later. No jumpers or hardware switch settings are required to configure the MODBUS communications network. This is done electronically from the front panel display.

NOTE: For MODBUS communications with the MRLDS-250, the default communications parameters are as follows.

- Baud rate = 9600
- Parity = no parity
- Stop bits = 1

Confirm that all devices on the MODBUS communications network (including a Building Management System) are configured similarly.

If the MRLDS-250 is at the end of the RS-485 network, be sure to set the RS-485 terminator on the printed circuit board (PCB) to IN. This applies a terminating resistor to the end of the wires per the requirements of the RS-485 protocol. The terminator should be set to OUT for all other installation conditions.

NOTE: Be sure to enable the termination resistor on the device at each end of the network (See Figure 3-7). This includes the Building Management System (if used).

CAUTION: Care should be exercised when changing the terminator switch. Before powering the gas detector, use a fine pointed device or paper clip to slide the switch position. Do not apply force to the switch or push on the switch with any device. The switch changes position up and down along the access slot direction.

Figure 3-7 - Setting Network Termination Resistors

3.6. Finish Installation

Once the base is mounted and all wiring is complete, align the gas detector housing and press it onto the base. The gas detector will snap into position, completing all electrical connections. Ensure the top and bottom snap locks are engaged.

NOTE: If the right cable gland was not needed during installation and wiring, be sure to install the blanking plug.

CAUTION: Do not apply caulking or other material around the gas detector base. The gas detector relies on air exchange through the spaces between the base and the gas detector housing. Do not obstruct the small gap around the housing and the base with any material.
4 Operation and Stabilization

4.1. Power Up and Warmup

On powering up, the MRLDS-250 will sense for the presence of gas after an initial warm-up period of two to five minutes. The green LED will flash at a one-second interval during the warm up.

4.2. Stabilization

CAUTION: It is vital when first installing the gas detector that it warms up in an atmosphere that is known not to contain any background concentrations of refrigerant. Emerson offers portable gas detectors for this purpose. Contact Technical Support for more information.

4.3. Perform a Manual Zero

After the gas detector stabilizes, the power LED stops flashing and is lit continuously. Emerson recommends manually zeroing the MRLDS-250 after a 1-hour stabilization period. Increase this stabilization period to 3 hours for freezer applications.

To manually zero the gas detector, press and hold the UP and DOWN buttons simultaneously for 5 seconds. The gas detector will beep and the display will show zerO when zeroing is complete. The display will show fail if the temperature is changing too quickly or there is an active alarm condition. Additionally, certain system faults (F.-08, F.-10 through 14, and/or F.-16) will prevent a manual zero from being performed.

4.4. Alarms

The following occurs during an alarm condition:

<table>
<thead>
<tr>
<th>Item</th>
<th>Behavior During Alarm State</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green LED</td>
<td>On (solid)</td>
</tr>
<tr>

</tr>
</tbody>
</table>

Table 4-1 - MRLDS-250 Behavior During Alarm Conditions
4.5. Gas Detector Faults

4.5.1. Overview

There are two levels of fault monitoring built into the gas detector:
1. Non-critical
2. Critical

4.5.2. Non-Critical Faults

Non-critical faults typically recover by allowing the gas detector surroundings to stabilize, for example, after a defrost cycle. The gas detector continues to monitor its surroundings during non-critical faults, but may report inaccurate readings.

The following occurs when a non-critical fault condition exists:

<table>
<thead>
<tr>
<th>Item</th>
<th>Behavior During Alarm State</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green LED</td>

<td>Modbus registers indicate the fault</td>
</tr>
</tbody>
</table>

Table 4-3 - MRLDS-250 Behavior During a Critical Fault

NOTE: The alarm feature includes a 20% deadband to prevent alarm “chatter” if the concentration hovers near the alarm setpoint. Once the alarm has been triggered, it will remain latched until the concentration drops below 80% of the alarm setpoint.
5 Configure the Gas Detector

5.1. User Interface Overview

The gas detector is configured through the built-in menu system. Once mounting is complete, attach the gas detector to the base and apply power.

![User Interface Diagram]

Figure 5-1 - The User Interface of the MRLDS-250

The user interface consists of four pushbuttons, a 4-digit LED numeric display, and a power LED. The four buttons allow the gas detector to be adjusted based on a parameter list shown below. Button functions are listed in Table 5-1.

Table 5-1 - Button Functionality

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>P-01</td>
<td>Maintenance Mode Sets gas detector to offline mode for 30 minutes. 00 Gas detector is online, with normal response to its surroundings (default). 01 Gas detector is offline, and suppresses all outputs. Display reads off (offline) during 30-minute timeout.</td>
</tr>
</tbody>
</table>

5.2. Setting Parameters

5.2.1. Overview

Press and hold the information button for five seconds to activate the parameter list:

Each parameter is shown in turn by using the UP or DOWN buttons. The parameter is shown as P.-XX, with XX being the parameter value. Pressing Enter while a parameter is displayed allows the attributes of the parameter to be set. Each Parameter has its own attributes, as shown in the following table. Set the attributes as desired, and then press Enter to save the setting.

5.2.2. Configuration Parameters
### Table 5-2 - Parameter Numbers, Names, and Descriptions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>P-02</strong> Alarm Setpoint</td>
<td>Sets desired PPM value (range 75 to 3500 ppm) above which alarm occurs. Use UP or DOWN buttons. For faster “coarse” adjustment, hold either button to sweep through the adjustment range quickly. <strong>Default setpoint is 200 ppm.</strong></td>
</tr>
</tbody>
</table>
| **P-03** Analog Output Type | Selects output type:  
00  Selects 0-5V  
01  Selects 1-5V (default)  
02  Selects 0-10V  
03  Selects 2-10V  
04  Selects 4-20 mA |
| **P-04** Alarm ON Delays | Sets the ON delay time (0-15 minutes) for the alarm output signals (relay, Modbus). **The default delay is 0 minutes.** |
| **P-05** Alarm OFF Delays | Sets the OFF delay time for the alarm output signals (relay, Modbus) in minutes (0-15). **The default delay is 0 minutes.** |
| **P-06** Relay Contact Behavior (Failsafe Mode) | Sets the default relay power state so that power loss can be detected. The behavior of the relay changes from energizing when an alarm condition occurs (default) to energizing at power up (Failsafe). In both cases the relay changes state when an alarm occurs, failsafe is simply inverted. This allows power failures to be detected as alarms.  
00  NO (default mode)  
01  Failsafe mode |
| **P-07** Relay Latching | Controls the relay latching behavior.  
00  OFF (default). Relay does not latch, and resets once the alarm condition is removed.  
01  ON. Relay remains latched; reset by BMS command by pressing and holding the Enter button for five seconds. |
| **P-08** Audible Alarm | The units have an internal audible alarm. You can disable this, but the default setting is “enabled” in compliance with EN378.  
00  OFF  
01  ON (default) |
| **P-09** Display Mode | The display can be turned on by using this parameter. When set to ON the display never shuts off (all operating modes). When ON the display shows the current gas concentration (or 0 if below the squelch). Note that P-09 is disabled if P-19=0.  
00  OFF during normal operation when the ppm value is below the alarm setpoint (default)  
01  ON  
In either case, the display will blink the measured PPM value during an alarm state. |
| **P-10** RS485 Node Address | Sets the RS485 node address (0001 to 0255) |

*Table 5-2 - Parameter Numbers, Names, and Descriptions*
### Gas Groups / Specific Gas Selection
Selects either gas group number for broadband operation or specific gas name for gas-specific mode.

- **Broadband:** Select from 4 groups of gases:
  1. R134a, R404a, R407a, R407c, R407f, R427a, R507, R514A, HFO1233ZD
  2. R448a, R449a, R422a, R422d HFO1234YF, and HFO1234Ze, R513a, R452a, R452B
  3. R22 (by itself)
  4. R32 (by itself).

- **Specific Gas:** The actual refrigerant name is shown. Select the appropriate refrigerant.

**NOTE:** Gas-specific detectors are factory calibrated to a single refrigerant using specialized manufacturing equipment. If another refrigerant is selected which differs from the factory calibrated setting, the built-in calibration no longer applies. Further improvement in detector accuracy may be gained by applying calibration gas containing the newly selected refrigerant and adjusting the gas detector reading to match (see Parameter P.-17).

### Buzzer Mute Time
Sets a time (0-59 minutes) during which the active buzzer remains muted:
- after the “I” button is pressed, or
- after Modbus register 4000 is set to 0.

### Baud Rate
Sets the baud rate for Modbus (RS-485) communications. 00 9,600 baud (default).

### Stop Bits
Sets the number of stop bits required to match the controlling communications equipment (for example, building management system, etc.).

- **01 1 stop bit (default)**
- **02 2 stop bits**

### Parity
Sets Modbus parity option.

- **00 None (default)**
- **01 Odd parity**
- **02 Even parity**

### Analog Output Scaling
Allows the user to select the full-scale PPM value that represents maximum analog output (for example, 20 mA) for scaling the analog output. Adjustment range is from 100 PPM to 3500 PPM.

- **Default = 3500 PPM.** (The setting cannot be adjusted above 3500.)

**NOTE:** Alarm values are not scaled, but are absolute values. Setting a smaller full scale does not correspondingly scale the alarm setting.

**NOTE:** When the PPM level is greater than the programmed analog output Full Scale PPM (P.-16), the analog output will go to a 10% over range state (indicating that the concentration is too high for the analog output to achieve). For example, for a 1-5V setting the analog output would go to 5.5V, for 4-20 mA it would go to 22 mA and so on.

---

**Table 5-2 - Parameter Numbers, Names, and Descriptions**
NOTE: The analog output signal range is from 100 PPM to the default value of 3500 PPM, which is scaled across the actual output range selected by the analog output type parameter P.-03. The upper PPM limit is programmable using analog output scaling parameter P.-16. This parameter sets the full scale PPM value creating a PPM range across which the analog output is scaled. See Figure 5-2 for more details.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gas Test Mode</td>
<td>Places the gas detector in gas test mode.</td>
</tr>
<tr>
<td>00 Disabled (default)</td>
<td>When enabled, the display continuously cycles through the following:</td>
</tr>
<tr>
<td>01 Enabled</td>
<td>• CAL is displayed briefly.</td>
</tr>
<tr>
<td></td>
<td>• Next, the gas group number or gas type (based on product code) is displayed.</td>
</tr>
<tr>
<td></td>
<td>• Then four dashes (----) are displayed.</td>
</tr>
</tbody>
</table>

After gas is applied and the 75 PPM squelch level is exceeded, the live concentration replaces the four dashes. See Section 6.4., Adjustment Using Calibration Gas if using Gas Test Mode to initiate the calibration procedure.

NOTE: To prevent false alarms, all outputs are suspended while Test Mode is active. The only live indication is the 4-digit display.

Once the gas test mode is enabled to perform a gas test or calibration, the unit will automatically go offline for a 10- minute period after the parameter list is exited. (This allows time for the test gas to clear before the unit becomes active)

If no activity occurs for ten minutes, the unit exits the Gas Test Mode.

Table 5-2 - Parameter Numbers, Names, and Descriptions
5.3. Completing Setup

To complete the setup after all parameters are set as needed, simply press and hold the information button for 5 seconds to exit the Parameter list: The gas detector is now actively monitoring its surroundings.

NOTE: If no buttons are pressed for two minutes, the MRLDS-250 exits setup mode automatically.
6 Functional Tests and Adjustments

6.1. Introduction

To comply with the requirements of EN378 and the European F-GAS regulation, gas detectors must be tested annually. However, local regulations may specify the nature and frequency of this test.

**CAUTION:** Check local regulations on calibration or testing requirements.

**CAUTION:** The MRLDS-250 contains sensitive electronic components that can be easily damaged. Do not touch or disturb any of these components.

**WARNING:** Annual checks and adjustment using calibration gas is recommended. Calibration gas adjustment frequency may be extended based on application, but should never exceed a time period of two years.

**WARNING:** In applications where life safety is critical, calibration gas adjustment should be completed quarterly (every three months) or on a more frequent basis. Emerson is not responsible for setting safety practices and policies. Safe work procedures including calibration policies are best determined by company policy, industry standards, and local codes.

**WARNING:** Before testing the gas detectors on-site, the MRLDS-250 must be powered up and allowed to stabilize.

**WARNING:** After initial installation, the MRLDS-250 should be gas tested to ensure proper operation.

**WARNING:** The testing and/or adjustment of the unit must be carried out by a suitably qualified technician, and must be completed:

- In accordance with this manual.
- In compliance with locally applicable guidelines and regulations.

Suitably qualified operators of the unit should be aware of the regulations and standards set down by the industry/country for the testing or calibration of this unit. This manual is only intended as a guide and, insofar as permitted by law, Emerson accepts no responsibility for the calibration, testing, or operation of this unit.

The frequency and nature of testing or calibration may be determined by local regulation or standards.

EN378 and the F-GAS Regulation require an annual check in accordance with the manufacturer’s recommendation.
6.2. Bump Testing vs. Adjusting Detector Response

There are two concepts that need to be differentiated:
- bump test
- gas detector response adjustment

A bump test exposes the gas detector to a gas. The operator then observes the gas detector’s response to the gas. The objectives are two-fold:
- establishes if the gas detector is reacting to the gas
- determines if all of the detector outputs are working correctly

There are two types of bump test:
- quantified: A known concentration of gas is used.
- non-quantified: A gas of unknown concentration is used.

Adjusting gas detector response exposes the gas detector to a calibration gas as well (like a quantified bump test), but additionally sets the actual gas detector response level (via parameter P.-17) to ensure that the gas detector activates at the specified gas concentration.

Refer to the following sections for additional information on bump testing and gas detector response adjustment.

---

CAUTION: Before you carry out the test or adjustment:

- Advise occupants, plant operators, and supervisors.
- Check if the gas detector is connected to external systems such as sprinkler systems, plant shut down, external sirens and beacons, ventilation, etc., and disconnect as instructed by the customer.
- For bump test or calibration, the MRLDS-250 should be powered up and fully stabilized (see Section 4, Operation and Stabilization).

---

6.3. Bump Testing

WARNING: Notify others that testing is underway. During bump testing, the alarm outputs are active and will trigger the intended response. It is the operator’s responsibility to ensure that such actions are acceptable and can be performed safely.

After installation and parameter setup (see Section 5, Configure the Gas Detector, the units should be bump tested. Expose the gas detector to test gas. The gas selected should be a high enough concentration to put the system into alarm and light the LED display.

With a bump test you can see the functions of the gas detector:
- the LED display will light and show the detected PPM concentration once the alarm setpoint is reached.
- the relay and audible alarm will function as configured including any delays set (ON or OFF).
- the output (0-10V, for example) will show the gas level.

Ideally bump tests are conducted on-site in a clean air atmosphere.

<table>

<th>Step</th>
<th>Bump Testing Using Calibration Gas Cylinders</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Remove the Splash Guard accessory if one is used.</td>
</tr>
<tr>
<td>2</td>
<td>Connect the regulator to the test gas port using 3 mm or 1/8” inside diameter tubing (see below).</td>
</tr>
<tr>
<td>3</td>
<td>Expose the gas detector to gas from the cylinder. Monitor the LED display reading. Refer to the Section 1.5., Specifications for acceptance criteria.</td>
</tr>
</tbody>
</table>

Table 6-1 - Bump Testing Using Calibration Gas Cylinders
6.4. Adjustment Using Calibration Gas

Adjustment Using Calibration Gas requires a gas cylinder with the appropriate gas and concentration. Note that a calibration kit if offered that consists of a calibration gas cylinder and a flow regulation valve with flexible non-absorbent tubing.

**NOTE:** For improved accuracy and response, the gas detector should be protected from excess drafts while performing the adjustment. Excess air circulation may dilute the applied calibration gas and lead to a lower than expected response.

<table>
<thead>
<tr>
<th>Step</th>
<th>Adjustment Using Calibration Gas Cylinders</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Connect the regulator to the test gas port using 3 mm or 1/8” inside diameter tubing.</td>
</tr>
</tbody>
</table>
| 2    | Enable parameter P-17 Gas Test Mode (see Section 5, Configure the Gas Detector). When enabled, the display continuously cycles through the following:  
  * CAL is displayed briefly.  
  * Next, the gas group number or gas type (based on product code) is displayed.  
  * Then four dashes (----) are displayed.  
  After gas is applied and the 75 PPM squelch level is exceeded, the live concentration replaces the four dashes.  
  NOTE: The analog outputs, relay activity, and RS-485 ppm reporting are suspended in Gas Test Mode to prevent false alarms. |
| 3    | Expose the gas detector to gas from the cylinder. Monitor the 4-digit LED display reading. |
| 4    | Wait for the PPM reading to stabilize. This should take approximately 4-6 minutes. Minor changes (less than 5 PPM in 10 seconds) are considered stable readings. Compare the response value with the calibration gas concentration. |
| 5    | Adjust the gas detector displayed value by using the UP or DOWN buttons to increase or decrease the value shown. Adjust until the reading is within ± 2% of the calibration gas. For example, if the calibration gas is 1000 PPM, the gas detector is adjusted properly when the displayed reading is between 980 and 1020 PPM. |
| 6    | Press the Enter button to store the new adjustment. Turn off the calibration gas and remove the tubing from the calibration port. If no further changes to the other Parameters are required, press and hold the information button for 5 seconds to exit the Parameter list. |

**Table 6-2 - Bump Testing**
If no further changes to the other parameters are required, press and hold the button for 5 seconds to exit the Parameter list. Upon exiting the parameters list, the gas detector will enter offline mode for a period of 10 minutes. This allows time for the calibration gas to dissipate after testing. During offline mode, the gas detector suppresses all outputs. The display reads \textit{OFFL} (offline) during 10 minute timeout.

\textbf{Table 6-2 - Bump Testing}

\textbf{NOTE:} All calibration gas mixtures have a blend tolerance. The tolerance will limit the actual adjustment accuracy that is achievable.
7 MODBUS Communications

7.1. Introduction

The MRLDS-250 gas detector can be configured to communicate on an RS-485 network using MODBUS-RTU protocol. Before configuring the gas detector for MODBUS communications, be sure your network connection is complete and your network termination switches are set appropriately. Refer to Section 3, Wiring and Configuration for details.

7.2. Communications Settings

There are 255 selections available to be set electronically, from addresses 1 to 255 inclusive. MODBUS data with a zero in the address field is received by all detectors (regardless of the address selected) to enable the master device to broadcast simultaneously to all the detectors.

Refer to the specifications section for information on RS-485 network communications parameters such as data bits, stop bits, and more.

7.3. Analog Input Registers

Analog input registers are read only and use function code 04.

8 Troubleshooting

8.1. Fault Codes

To comply with the requirements of EN378 and the European F-GAS regulation, gas detectors must be tested annually. However, local regulations may specify the nature and frequency of this test.

The MRLDS-250 features sophisticated internal status monitoring and will indicate whether a fault condition exists on the front display (F.-XX, with XX being the fault number).

There are two classes of fault conditions: critical and non-critical. In general, non-critical faults occur when environmental conditions exist that are outside the product’s specified operating range, or if an installation error has occurred (for example, incorrect wiring).

The gas detector will typically continue to monitor its surroundings (except for fault F.-08), and may report inaccurate readings and false alarms. Correcting non-critical faults is a matter of waiting for the environmental conditions to return to a more typical condition, correcting wiring mistakes, or in some cases, relocating the gas detector. For example, placing the gas detector near a forced air heater may cause temperature faults. The non-critical fault range is F.-01 to F.-08.

Critical faults indicate a functional problem that results in the gas detector no longer monitoring its surroundings for refrigerant.

The fault number is displayed and the power LED is turned off, indicating that the gas detector is offline. The critical fault range is F.-09 to F.-16. If any of these faults occur, first try to clear the faults by cycling power to the sensor. The easiest way to do this is by removing the sensor from the base and reattaching it. If the fault returns after cycling power, the gas detector should be removed from service and replaced.

Additionally, the faults are stored as a hex number and can be accessed in the Diagnostics menu P.-18. The associated hex codes are listed next to the Fault Code in (Table 8-1). Refer to Diagnostics Menu P.-18 in Section 8.2., Diagnostic Attributes (P.-18) for additional information.

**8.2. Diagnostic Attributes (P.-18)**

Use this option to review the built-in diagnostic attributes. Access the parameter list (see Section 5, Configure the Gas Detector) and select P.-18. Press the Enter button to access the diagnostics, and then use the UP or DOWN button to select each attribute. The following information is available.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays the current fault condition code in hex format:</td>
<td></td>
</tr>
<tr>
<td>0000 = no faults are active</td>
<td></td>
</tr>
<tr>
<td>XXXX = HEX number</td>
<td></td>
</tr>
<tr>
<td>See Table 8-1 for the HEX format cross reference.</td>
<td></td>
</tr>
<tr>
<td>Displays a hex format code that corresponds to any faults that occurred since the internal fault record was last erased. See Table 8-1 for the HEX format cross reference. The records may be erased by pressing the ENTER button.</td>
<td></td>
</tr>
<tr>
<td>Displays the number of days that the MRLDS-250 has been in service. The value of this attribute rolls over after 9999.</td>
<td></td>
</tr>
</tbody>
</table>

*Table 8-2 - Diagnostics Attributes*
8.3. Resetting the MRLDS-250 to Default Values

The gas detector may be reset to its default state, if needed, to aid in troubleshooting. All settings, including alarm setpoint, gas adjustments, selected gas curve, calibration data, Modbus address, etc. revert to specific default values after a reset. The broadband sensor option (P/N 809-0030) resets to gas group 1. Gas specific products (P/Ns 809-0031 to 809-0044) are reset to the R134a gas curve. Note: Calibrations on either gas-specific or broadband models are lost after a reset. This returns the gas detector to an uncalibrated condition. See parameter P.-17 for information on how to recalibrate the gas detector.

**NOTE:** Before performing this operation, it is advisable to write down all the parameter settings so they can be re-programmed.

**NOTE:** Before performing this operation, it is advisable to write down all the parameter settings so they can be re-programmed.

### 8.4. Other Symptoms

Other common wiring problems can also cause the gas detector to malfunction. Check below for additional conditions that will cause gas detector issues.

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Press and hold both the UP and DOWN buttons for 5 seconds. This will cause the following to occur: • All the LED segments will then light for 3 seconds. • The gas detector resets to the default settings. • The gas detector beeper sounds for 3 seconds.</td>
</tr>
<tr>
<td>2</td>
<td>After 3 seconds, the user is returned to the parameter list at parameter P.-18.</td>
</tr>
<tr>
<td>3</td>
<td>The gas detector may now be re-programmed for further troubleshooting if needed.</td>
</tr>
</tbody>
</table>

### Table 8-4 - Other Symptoms and Possible Causes

**Symptom** | **Possible Cause(s)**
--- | ---
Alarms in the absence of a leak | If you experience alarms in the absence of a leak, try setting an alarm delay. Perform a bump test to ensure proper operation.

**NOTE**: The gas detector response time will lengthen when the Splash Guard is used. The installer is responsible for determining whether the response time is suitable for the application.
